

# Profit per hour as target process control parameter for resource productive manufacturing systems enabled by big data analytics and industry 4.0 infrastructure

Dipl.-Ing. Markus Hammer

20. Techno-Ökonomie-Forum  
Leoben, November 14<sup>th</sup>, 2016

“The **search for the one objective** is essentially a search **for a magic formula** that will **make judgement unnecessary**. But the attempt to replace judgement by formula is always irrational; **all the can be done is to make judgement possible** by narrowing its range and the available alternatives, giving it clear focus a sound **foundation in facts and reliable measurements** of the effects and validity of actions and decisions.”<sup>1</sup>

<sup>1</sup> Drucker, Peter (1955) – The practice of management, Chapter 7: The Objectives of a Business, p.59

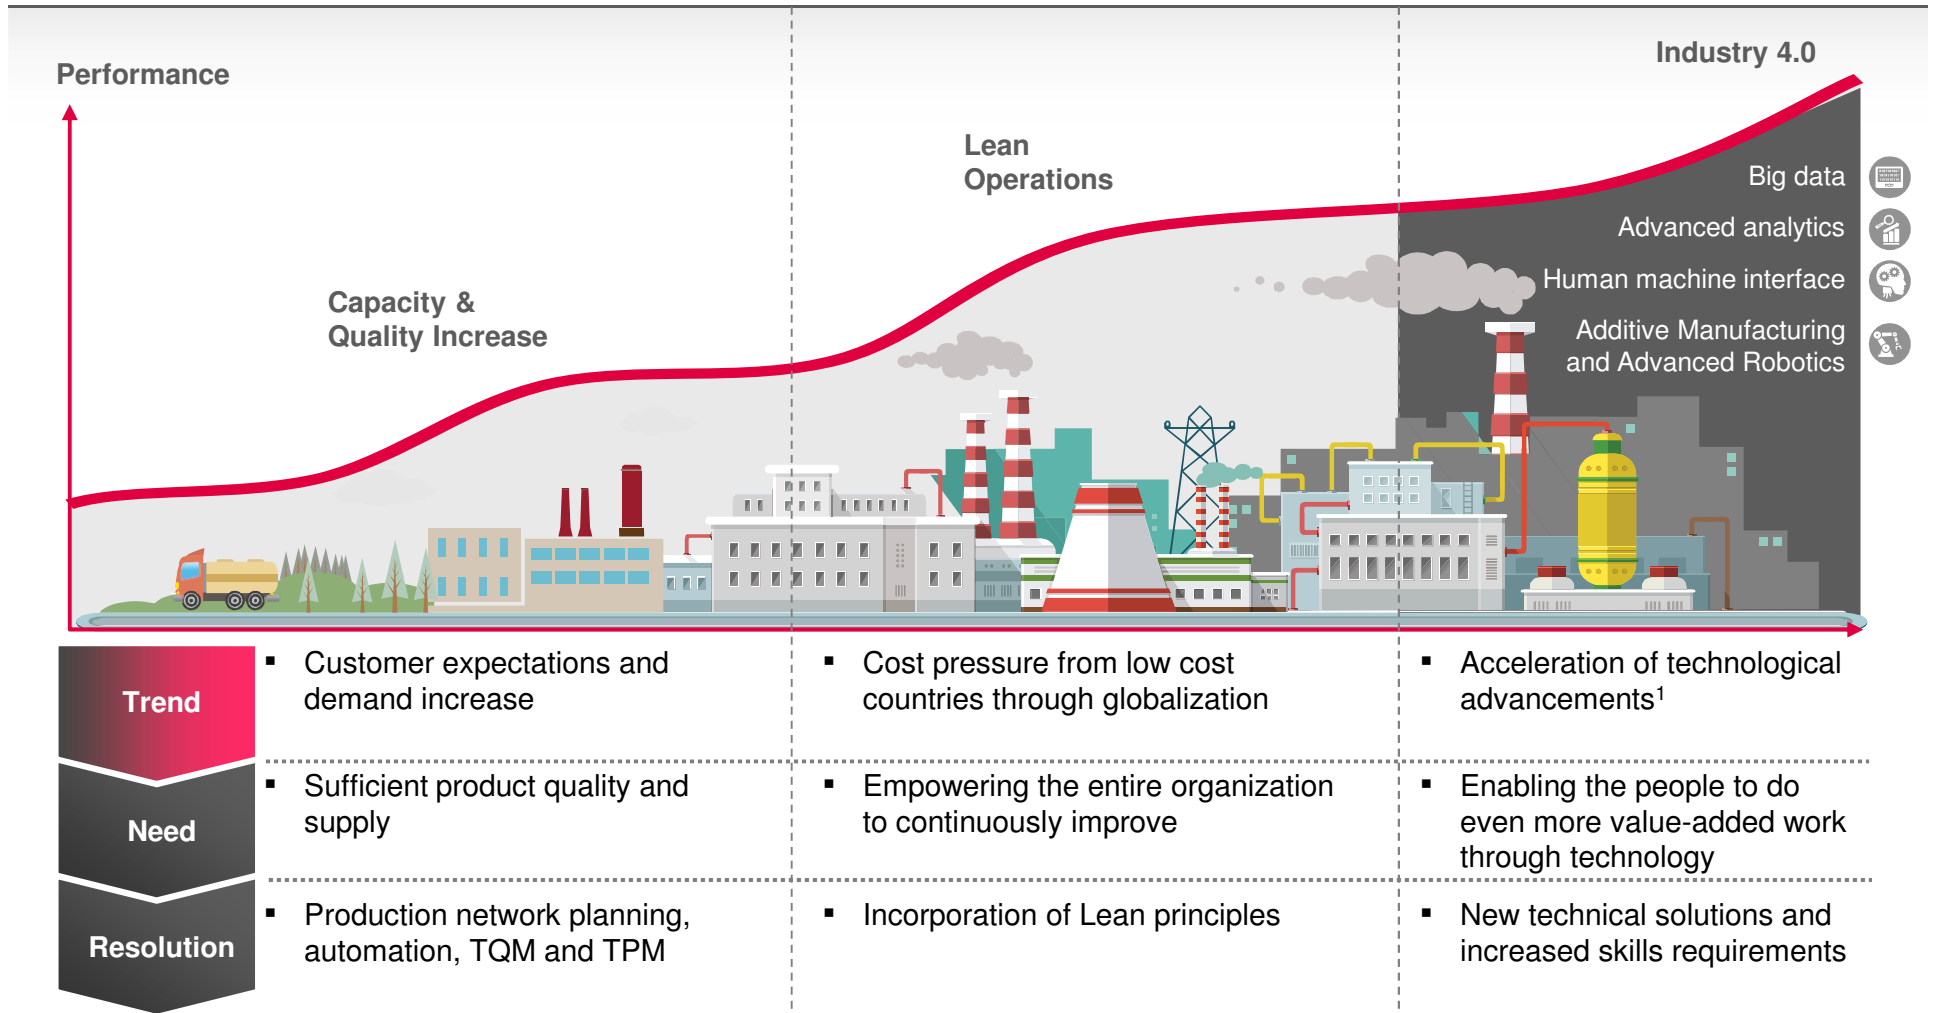

---

## Objectives for today's discussion

- **Motivation**

- Research focus, questions & hypotheses
- State of the art & literature review
- Next steps

# Industry 4.0 is impacting operations through disruptive technologies including big data and advanced analytics

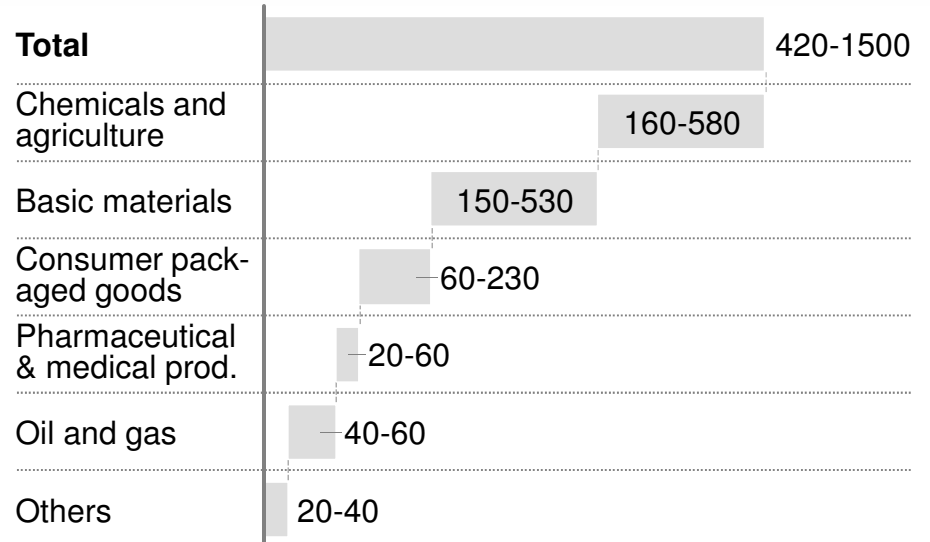

<sup>1</sup> Cheaper storage, increasing computing power, cloud technology, affordable sensors, reliable data transmission, machine learning

# For manufacturing industries there is considerable value to be captured...

**Manufacturing produces more data than any other industry**<sup>1</sup>. Annual new data stored by sector, 2010, Petabyte

**Potential economic impact from productivity improvements in manufacturing by 2025, USD bn<sup>2</sup>**

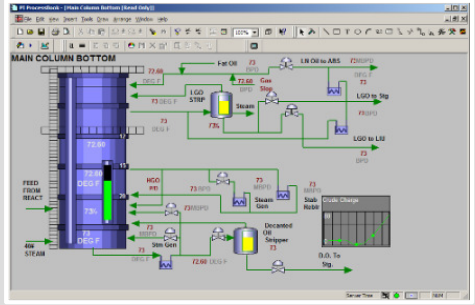

In the factories, value from the **Internet of Things** would arise chiefly from **productivity improvements**, including **10 to 20 percent energy savings**<sup>2</sup>

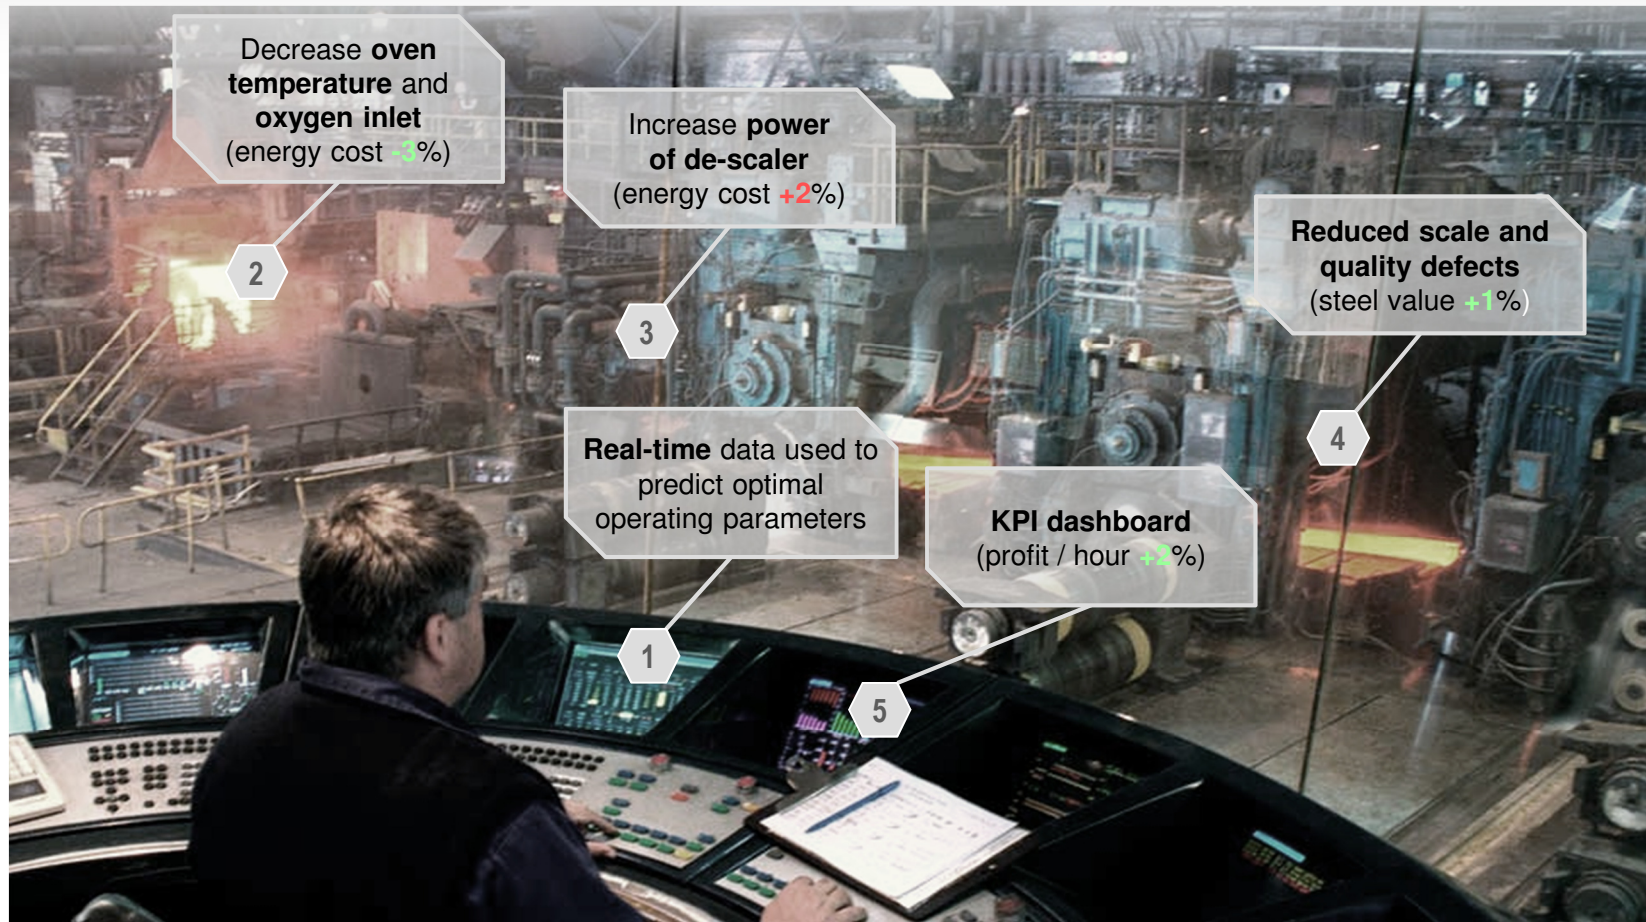

<sup>1</sup> IDC (2015), <sup>2</sup> MGI (2015)

# ...and process industries are not starting from zero with data utilization and industrial automation

<p><b>A</b></p>		<p>Data generation and harvesting has been done for many years with sensors</p>
<p><b>B</b></p>		<p>Data structuring and illustration happens already e.g. PI (Process information) systems</p>
<p><b>C</b></p>		<p>Automated decision-making is being done via Advanced Process Control systems</p>

# The goal: Enabling smart operational decision making to optimize for profit per hour in a volatile environment

ILLUSTRATIVE

**Advise the control room operator and process engineers on the optimal settings to maximize profit**

---

## Objectives for today's discussion

- Motivation
- **Research focus, questions & hypotheses**
- State of the art & literature review
- Next steps

# How to optimize operations for maximum profitability using a profit per hour management approach

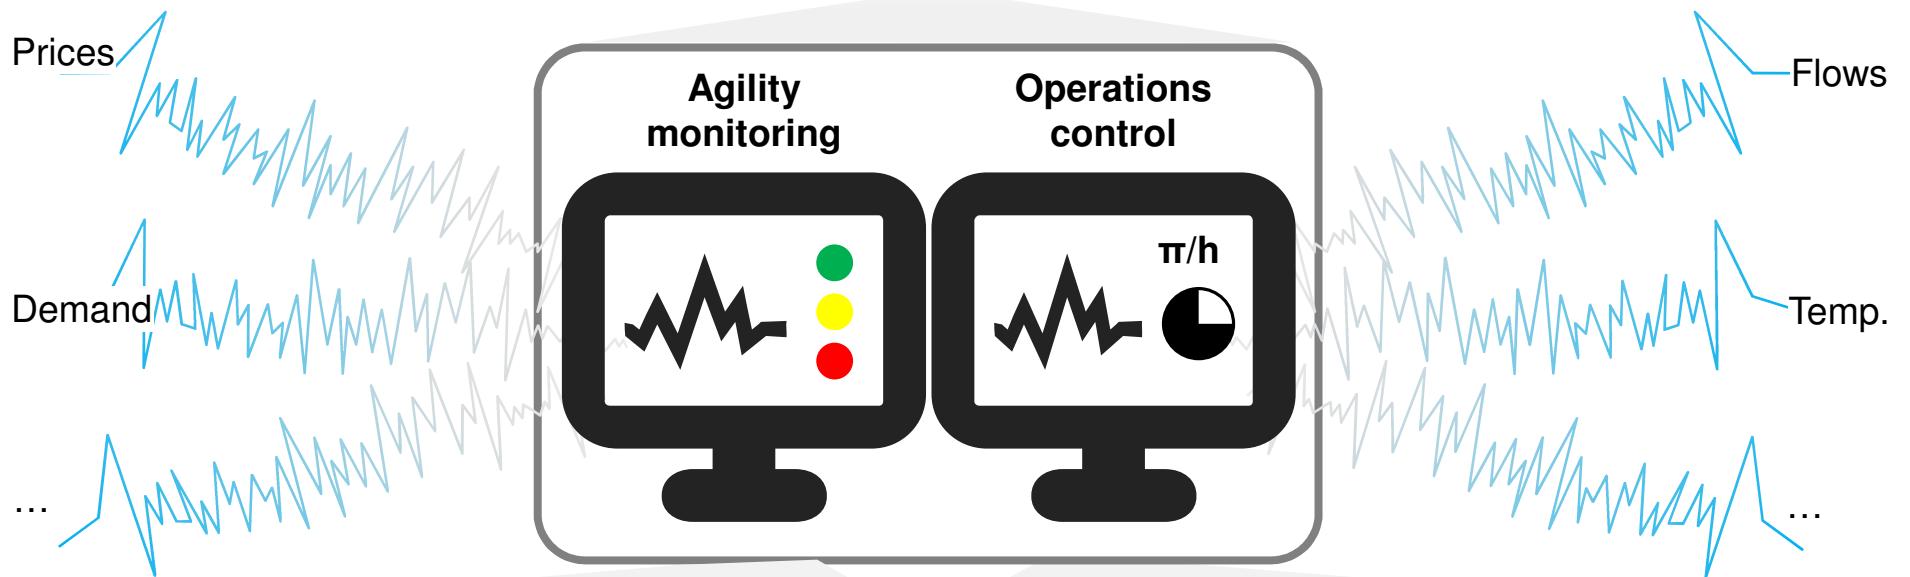

**External focus** (Markets, supply network,...)

**Internal focus** (Manufacturing system)

**Volatility**

**Agility strategy**

**Operations**

*Research in progress by  
agility working group<sup>1</sup>*

- Process control based on profit/hour target KPI
- Advanced analytics of big process data
- Industry 4.0 infrastructure

<sup>1</sup> Heldmann (2015)

# Link to Agility Research

## Steigende Unsicherheit

## Agiles Unternehmenssystem

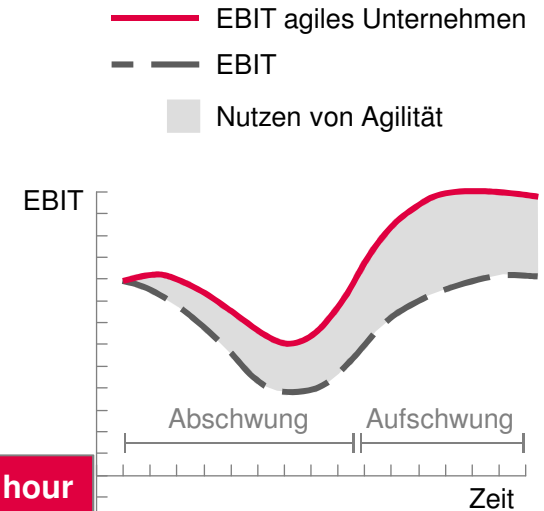

## Unternehmensperformance

### Treiber

- Vernetztheit
- Digitalisierung
- Granularität
- Disruptionen

### Auswirkungen

- Nachfrageschwankungen
- Produktionsstörungen
- Lieferkettenunterbrechung
- Volatilität der Faktorkosten

### Operations-Stellhebel

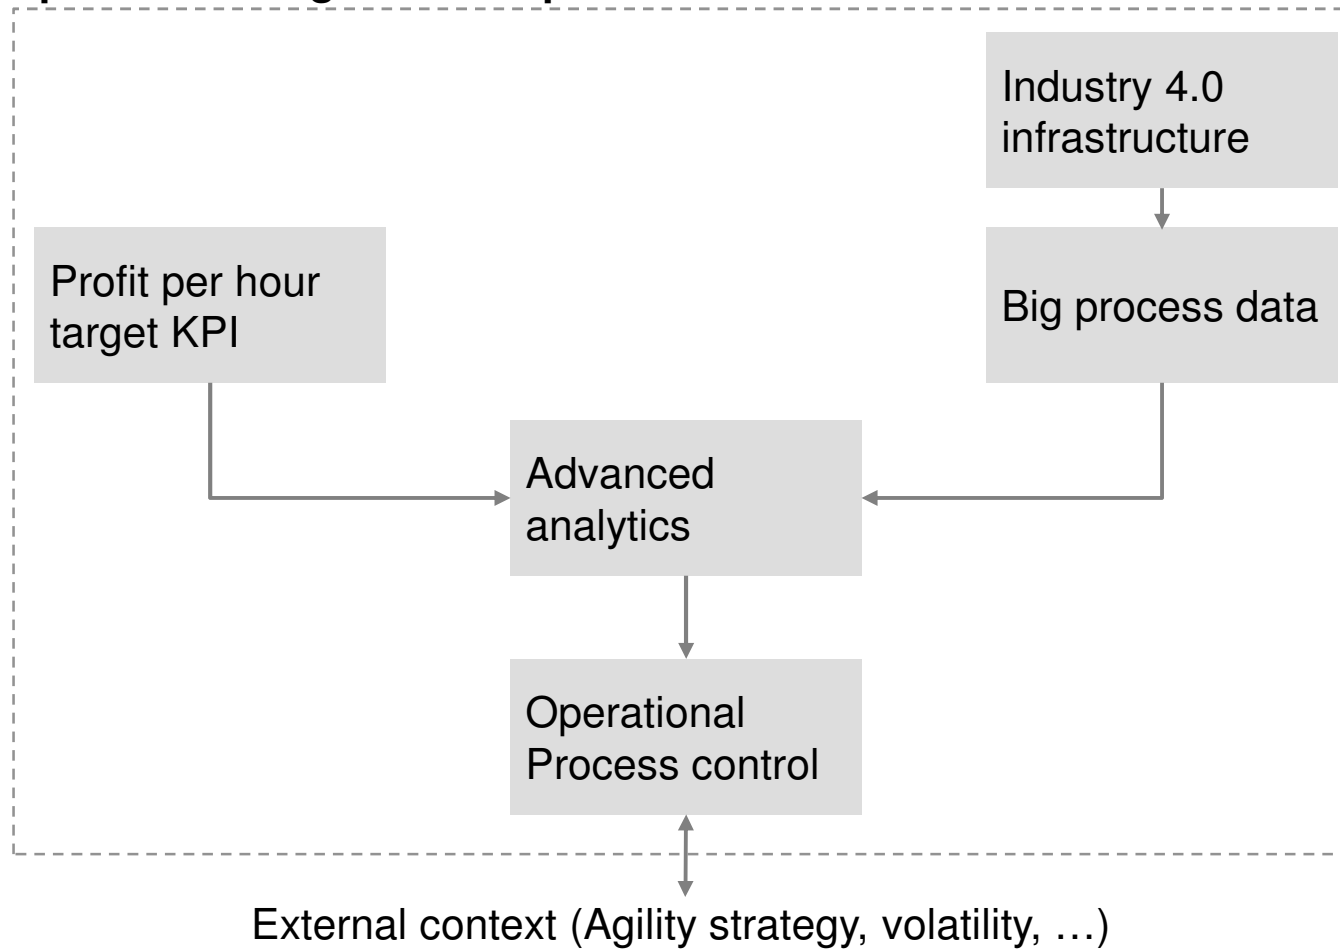

- Arbeitsorganisation
- Produktionsanlagen
- Produktionsnetzwerk
- Beschaffung
- Logistik
- Produktgestaltung

<sup>1</sup> Finanzen, HR und weitere indirekte Bereiche (G&A)

<sup>2</sup> Ramsauer, Kayser, Schmitz (2016)

# Research framework

## Methodology to implement a profit/hour as operational target control parameter

# Research gap, end products, and delimitation of research focus

## Research gap

- Profit per hour as target process control parameter for resource productive manufacturing systems enabled by big data analytics and industry 4.0 infrastructure

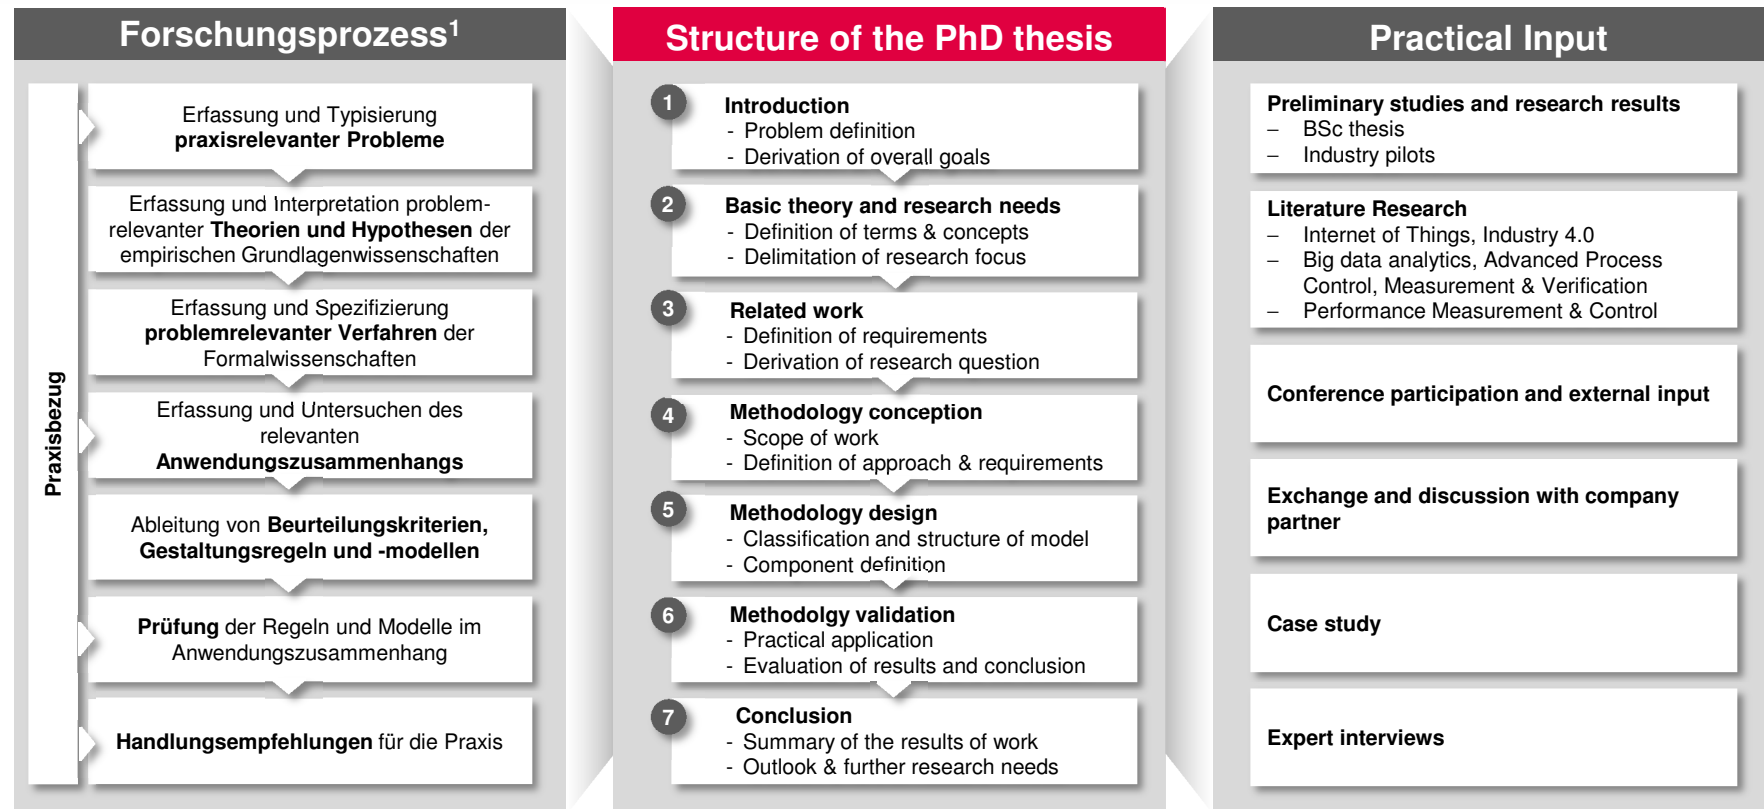

## End products

- Proof of profit per hour as operational target KPI
- Evidence of big data analytics as enabler
- Methodology for implementation
- *Optional: Tools (Cockpit, Checklist, ...)*

## Delimitation of research focus

- Production / Manufacturing Systems
- Process Industries
- Bottleneck processes
- Not inventing new algorithms, sensors, ...

# Research approach and inputs for the PhD thesis

<sup>1</sup> Idealtypischer Forschungsprozess der anwendungsorientierten Betriebswirtschaftslehre nach ULRICH (1984)

## Profit per hour as target process control parameter for resource productive manufacturing systems enabled by big data analytics and industry 4.0 infrastructure

Research focus	Hypotheses: <span style="float: right;">PRELIMINARY</span>
<p>BASIC THEORY REVIEW:  <b>Is a profit per hour</b> management approach <b>helping to take best available decisions</b> in process industries to achieve maximum EBITDA in volatile times?</p>	<ul style="list-style-type: none"> <li>▪ Profit per hour is a <b>suitable target KPI</b> for industrial operations management in manufacturing trading off conflicting targets (throughput, energy, yield, ....)</li> <li>▪ <b>Cumulative benefits</b> of a profit per hour approach <b>are higher</b> than traditional methods (e.g. throughput maximization)</li> <li>▪ <b>Limitations</b> to profit/hour (long vs. short term optimization, balance between economic and social benefits) exist</li> </ul>
<p>RESEARCH QUESTION 1:  <b>Is big data</b> in manufacturing (i.e. both real time process data and advanced analytics) <b>a key enabler for a profit per hour</b> management approach?</p>	<ul style="list-style-type: none"> <li>▪ H1.1: <b>Big process data</b> is a key enabler to implement a profit per hour operational management approach</li> <li>▪ H1.2: <b>Advanced algorithms</b> are required to solve for profit per hour as a target function</li> <li>▪ H1.3: A live <b>decision cockpit</b> is a key tool for managers/operators <b>prior to full automated advanced process controls (APC+)</b></li> </ul>
<p>RESEARCH QUESTION 2:  <b>Can a profit per hour</b> operative management approach based on big process data <b>be implemented in a standardized way</b> (step-by-step methodology) in process industries?</p>	<ul style="list-style-type: none"> <li>▪ H2.1: A repeatable <b>standard process can be applied</b> to implement a profit per hour management approach in process industries</li> <li>▪ H2.2: The steps taken follow <b>classical management frameworks</b> such as DMAIC and can include aspects of automation (e.g. APC)</li> <li>▪ H2.3: <b>Measurement &amp; Verification</b> is a crucial element to verify financial savings over time</li> </ul>

- Research focus, questions & hypotheses
- **State of the art & literature review**
- Next steps

# Management Accounting & Control has a long history with many issues related to performance measures

## Analytical Modeling of Cost in Management Accounting Research

“The problem of control is defined as that of choosing **operating rules** for members of an organization and enforcement rules for the operating rules so to maximize the organization’s **objective function**”<sup>1</sup>

“...the **process by which managers assure** that resources are obtained and used effectively and efficiently in **the accomplishment of the organization’s objectives**”<sup>2</sup>

“**The objective of the firm is** to find the output-input combination that results in the **maximal profit.** [...] **A cost model** is viewed as a representation of the underlying economic structure of the firm. This is a rather **complex problem** and a **demand for simplification** is evident.”<sup>3</sup>

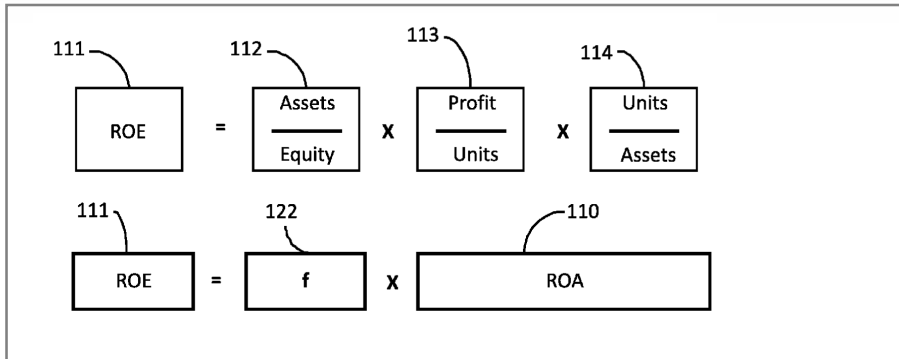

## Issues associated with individual measures of performance Issues associated with individual measures of performance include<sup>1</sup>:

- Should measures **focus on processes**, the outputs of processes, or both?
  - **Is time the fundamental** measure of manufacturing performance?
  - How can the measurement of **total factor productivity** be simplified?
  - How can performance measures be designed so that they **encourage inter-functional co-operation**?
  - How can measures which do not encourage **short-termism** be designed?
  - How can performance measures be designed so that they **encourage appropriate behaviour**?
  - How should the data generated as a result of a particular measure **be displayed**?
  - How can one ensure that the management **loop is closed** - that corrective action follows measurement?
  - [...]
- The final issue, and one which has not yet been touched, is that of **predictive performance measurement**. The assumption underpinning this review, and indeed much of the work on performance measurement to date, is that **managers use measures both to monitor past performance and stimulate future action.** [...] A key item on the performance measurement research agenda must therefore be the identification, and/or development, of “**predictive performance measures**”.

<sup>1</sup> Arrow (1964); <sup>2</sup> Anthony (1965), <sup>3</sup> Christensen (2006), <sup>4</sup> Neely (1995)

# Time-based Performance Management Systems and Computer-Aided System for Improving ROA exist

DuPont™ model for ROE from 1912<sup>1,3</sup>

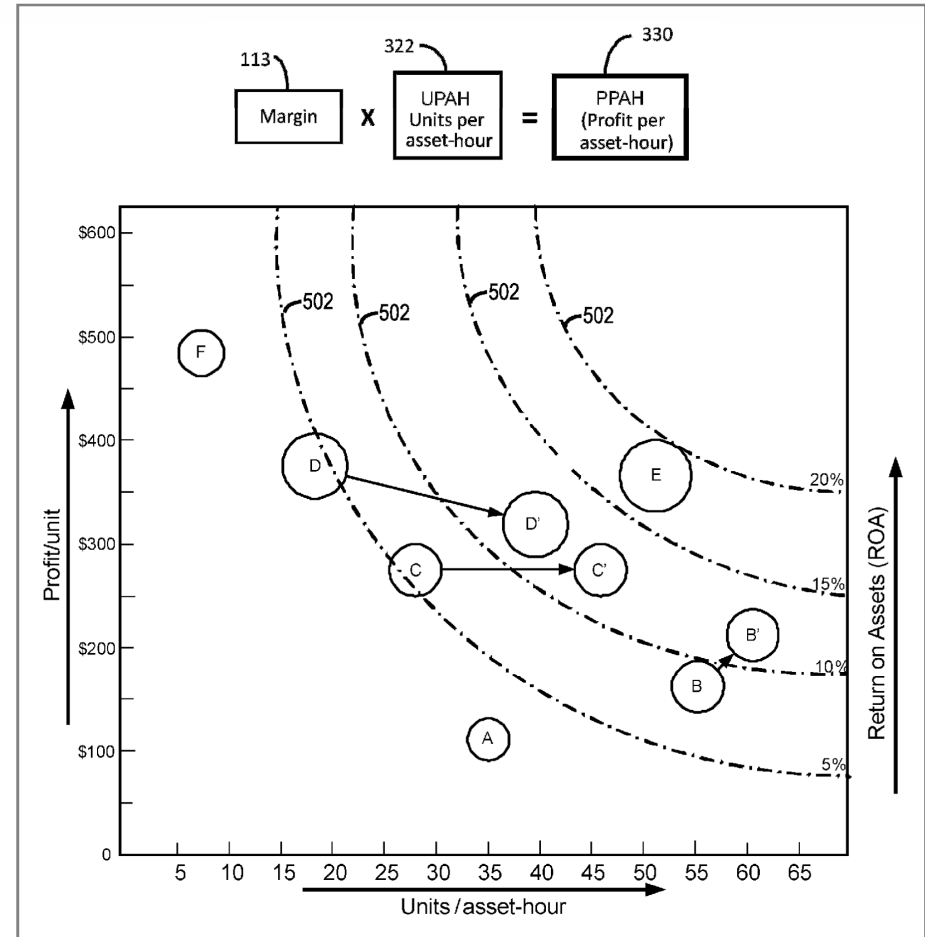

Time-based costing system known as throughput accounting<sup>2</sup>

[...] **the rate at which a product contributes money compared to the rate at which the factory spends it that determines absolute profitability.**

$$\text{Return per factory hour} = \frac{\text{Sale price} - \text{material cost}}{\text{Time on the key resource}}$$

$$\text{Cost per factory hour} = \frac{\text{Total factory cost}}{\text{Total time available on the key resource}}$$

Profit Velocity model linking profit per asset-hour to ROA<sup>3</sup>

1 Phillips (2015), 2 Galloway and Waldron (1988-89), 3 Pending patent US 2016/0092892 A1 (2015) "Computer-Aided System for Improving ROA", applied by Profit Velocity Solutions, LLC

# Advanced analytics expands beyond the reach of APC systems and allows for production optimization at scale

## Evolution and revolution?

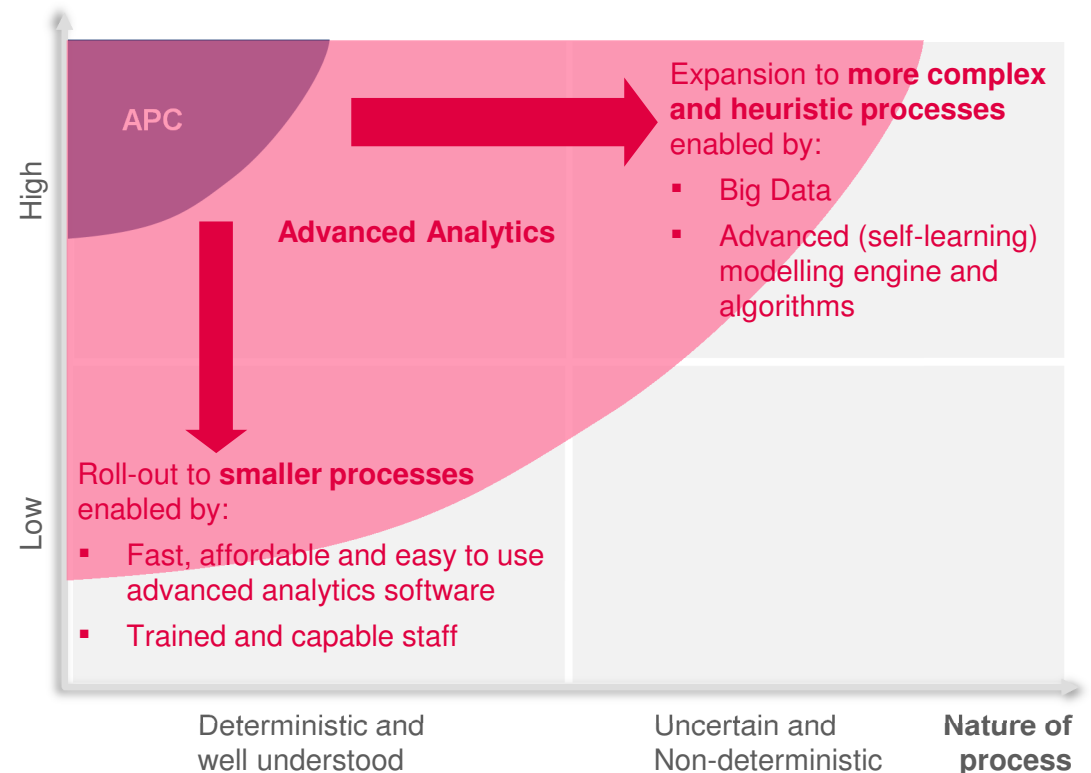

“[...] the **general activity of making sense** of data has evolved **from decision support, to executive support**, to online analytical processing, to business intelligence, to analytics and now to “big data”.”<sup>1</sup>

“**Operational analytics** are embedded, automated decision making processes that prescribe and **cause actions to occur in decision time**.

- **Analytics 1.0** [...] focused on **batch analysis** of internal structured data
- The **Analytics 2.0** era represents the rise of big data. It includes **new types of data, new analytical methods**, and the use of external data.
- The **Analytics 3.0** era **enables operational decisions** [...] it evolves the best of Analytics 1.0 and 2.0 towards a unified analytics approach.”<sup>2</sup>

## Advanced analytics expands beyond APC systems<sup>3</sup>

Value at stake  
€

APC = Advanced Process Control 1 Davenport (2014), 2 Franks (2014), 3 McKinsey (2016)

# Breaking down EBIT per time with analytics will help identify performance drivers and operational actions

Formula view

$$\begin{aligned}
 \text{EBIT} = & \left[ \sum_{\text{all products}} \text{tons}_{\text{product}} \times \frac{\text{revenue}}{\text{ton}} + \sum_{\text{all energy types}} \text{energy generated units} \times \frac{\text{revenue}}{\text{unit}} \right] \\
 & - \left[ \sum_{\text{all raw materials}} \text{tons}_{\text{raw material}} \times \frac{\text{cost}}{\text{ton}} + \sum_{\text{all energy types}} \text{energy consumed units} \times \frac{\text{cost}}{\text{unit}} + \sum_{\text{all waste types}} \text{tons}_{\text{waste}} \times \frac{\text{cost}}{\text{ton}} \right]
 \end{aligned}$$

Callouts for the first part of the formula:
 

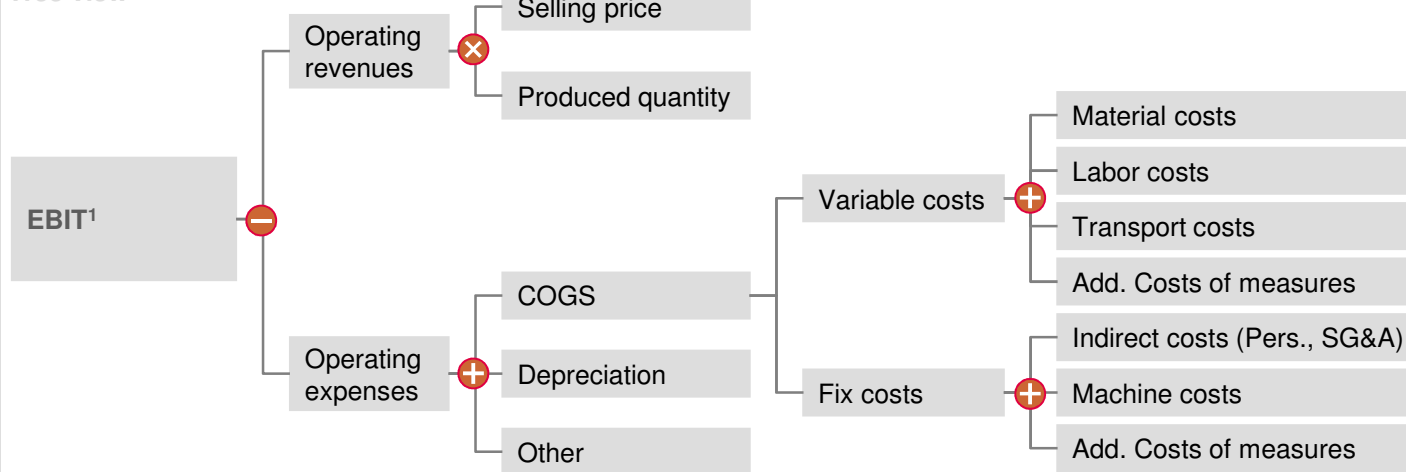

- f (through-put, yield) - points to  $\sum_{\text{all products}} \text{tons}_{\text{product}}$
- f (product mix, pricing) - points to  $\frac{\text{revenue}}{\text{ton}}$
- f (through-put, yield) - points to  $\sum_{\text{all energy types}} \text{energy generated units}$
- f (energy pricing) - points to  $\frac{\text{revenue}}{\text{unit}}$

Callouts for the second part of the formula:
 

- f (through-put) - points to  $\sum_{\text{all raw materials}} \text{tons}_{\text{raw material}}$
- f (raw materials pricing) - points to  $\frac{\text{cost}}{\text{ton}}$
- f (through-put, yield) - points to  $\sum_{\text{all energy types}} \text{energy consumed units}$
- f (energy prices) - points to  $\frac{\text{cost}}{\text{unit}}$
- f (through-put, yield) - points to  $\sum_{\text{all waste types}} \text{tons}_{\text{waste}}$
- f (waste charges) - points to  $\frac{\text{cost}}{\text{ton}}$

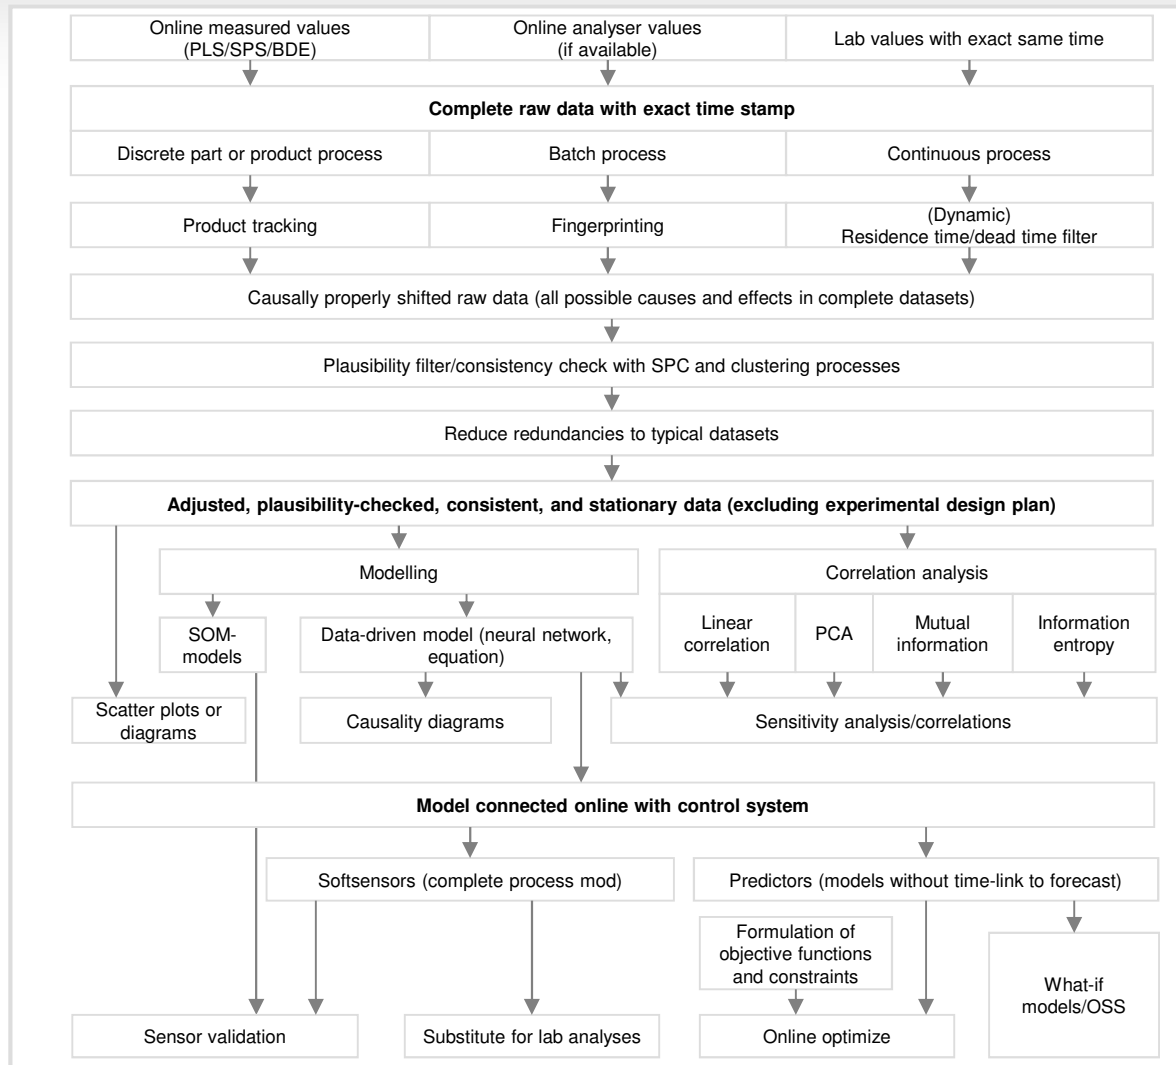

Incorporating tradeoffs like yield, throughput, energy and raw material consumption in one single, time-based profitability as decision basis

Tree view

1 Bernstein (1974)

# The society of German Engineers drafted a “standard” big data workflow for production processes

“This status report describes the **best-practice workflows in industrial big data projects**. The description explains each individual step **with reference to the DMAIC method from Six Sigma[...]**”<sup>1</sup>

1 VDI/VDE/GMA FA 7.24 (2016)

## Objectives for today's discussion

- Motivation
- Research focus, questions & hypotheses
- State of the art & literature review
- **Next steps**

## Next steps and questions for input

**Finalization of  
literature review and  
theory development**

**Application in  
industrial case  
study**

**Validation of  
approach and  
conclusion**

### **Questions:**

- What other initiatives are relevant for my work?
- Who else would you recommend me to talk to in academia and industry?
- What is your view on
  - industry 4.0 in process industries
  - data-driven decision making systems in manufacturing
  - time-based, financial performance metrics
